BEYONDPROOF | 2-Minute Executive Pitch Script & Demo Guide

Universal Digital Trust & Forensic Verification Platform • Hackathon Judge Presentation Deck

1. The 120-Second Pitch Timeline (Word-for-Word Script)

Time	Phase & Focus	Spoken Script (What to Say)	Demo Action (What to Click)
0:00 - 0:25 (25 sec)	**The Hook & Problem** **AI Fraud Epidemic**	*"Judges, in 2026, generative AI can forge a passport in 3 seconds, alter legal contract terms in one click, and clone audio seamlessly. Today's detection tools are unreliable black-boxes that spit out random percentage guesses with zero legal evidence. Enterprises cannot act on guesses. They need mathematical proof."*	**Start on Dashboard (/dashboard). Show live platform stats and multi-vector threat landscape.**
0:25 - 0:50 (25 sec)	**The Solution** **BEYONDPROOF Core**	*"That is why we built **BEYONDPROOF**. Instead of guessing, BEYONDPROOF executes **7 local, deterministic forensic microservices**. We inspect raw font glyph streams in PDFs, compute Error Level Analysis on image pixels, validate international ICAO passport checksums, and trace cryptographic provenance. 100% locally—zero cloud API costs, zero customer data leakage."*	**Point to the 7 Active Microservices badge. Emphasize self-contained local execution.**
0:50 - 1:30 (40 sec)	**Live Demo & Proof** **Inspection & Graph**	*"Watch it in action: On our **Document & Identity Engines**, we extract portrait biometrics and mathematically compute the ICAO 7-3-1 modulo-10 checksum to catch fake passports instantly. On **Source Tracker**, we compare suspect files against baselines using perceptual pHash hamming distances. And fraud is never isolated: our **Trust Graph** uses NetworkX to dynamically map files, user custody, and threat nodes in an interactive relational graph."*	**1. Click Verification Result (show circular Risk Gauge).** **2. Open Trust Graph (highlight connected nodes).** **3. Click Download Forensic Dossier.**
1:30 - 1:50 (20 sec)	**Market & ROI** **Enterprise Value**	*"Every verification synthesizes into an explainable Bayesian risk score. This unlocks three massive enterprise verticals: **Fintech & Banking** for automated KYC fraud prevention, **Insurance** for tamper-evident claim photo analysis, and **Legal/Compliance** audits. We turn hours of manual forensic analysis into 4 seconds."*	**Show the dynamic Recommended Actions card (Certified for Ingestion vs Quarantine).**
1:50 - 2:00 (10 sec)	**Closing Hook** **The Punchline**	*"Don't trust an AI score. **Prove it with BEYONDPROOF**. Thank you, and we welcome your questions!"*	**End on the Forensic PDF Report cover or Dashboard overview.**

2. Live Demo Click Sequence (120-Second Screen Execution)

Step	URL Route	On-Screen Visual Highlight & Talk Track	Time
1	/dashboard	Overview of 7 active engines, platform health, and multi-vector verification stats.	**15s**
2	/verification/<id>	Show circular **Risk Gauge**, individual engine findings, and raw byte/pixel proof.	**35s**
3	/trust-graph	Drag and inspect the interactive relational graph connecting files, user custody, and threat nodes.	**30s**
4	Download Report	Click **Download Forensic Dossier** to open the tamper-evident, court-ready PDF.	**25s**
5	/risk or /source	Show explainable Bayesian weight distribution and dual-file perceptual pHash diffing.	**15s**

3. Key Competitive Differentiators (Why BEYONDPROOF Wins)

Dimension	Conventional AI Detectors (Hive, Copyleaks)	BEYONDPROOF Platform
Forensic Method	Black-box neural network probability (hallucination-prone).	**Deterministic, multi-layered signal forensics** (PyMuPDF, OpenCV, ELA, pHash).
Evidence Level	Vague percentage score (e.g., “82% likely AI”).	**Specific finding codes** with raw byte offsets, checksums, and pixel deltas.
Data Privacy	Uploads sensitive passports & contracts to 3rd-party clouds.	**100% self-contained local execution** (air-gapped & enterprise ready).
Coverage	Single-purpose: only images OR only text.	**Unified: PDF Documents, Images, Video, Audio, & Passports/IDs**.
Legal Output	None (inadmissible in legal or compliance disputes).	**Tamper-evident, signed PDF Dossier** with SHA-256 custody anchors.

4. Rapid-Fire Judge Q&A Defense Cheat Sheet

Q1: "Why not just use an LLM or deep vision model to detect fakes?"

A: "LLMs hallucinate and cannot provide legal chain-of-custody. In court, saying 'an AI thinks this is fake' is inadmissible. BEYONDPROOF relies on deterministic signal analysis—byte streams, font dictionaries, and ICAO mathematical checksums. We provide mathematical proof, not opinions."

Q2: "What if an attacker strips metadata from an image or PDF?"

A: "Stripping metadata triggers immediate provenance anomaly flags. Moreover, physical signal properties cannot be hidden: Error Level Analysis detects JPEG recompression deltas, font stream parsers detect un-embedded glyphs, and MRZ checksums cannot be spoofed without valid personal data."

Q3: "How does this scale to millions of enterprise transactions?"

A: "Every engine is an independent microservice orchestrated asynchronously via FastAPI and WebSockets. In production, each engine scales horizontally on Kubernetes pods, processing thousands of files per minute with sub-second single-engine latency."

Q4: "Who are your target paying customers?"

A: "Three enterprise verticals: (1) Fintech banks pay per KYC verification to eliminate fake identity onboarding, (2) Insurance firms license on-premise for fraud-free claims processing, and (3) Law firms pay for verifiable forensic evidence dossiers."

PRO TIP FOR THE STAGE: Deliver the 3 visual highlights: (1) Risk Gauge, (2) Interactive Trust Graph, and (3) Downloaded PDF Dossier. Hand the judges the PDF or point to the screen when delivering your final punchline: *“Don't trust an AI score. Prove it with BEYONDPROOF.”*
